

ENVIRONMENTAL POLICY

At Delta Uranium, health, safety and environmental matters are an integral part of our exploration business. Our belief in social responsibility integrity and stewardship is evident in our initiatives and operations supporting sustainable environmental practices, especially at the local levels as demonstrated in our Toronto and Kenora offices. Particularly, our reduce, reuse and recycle programs support the goal of preserving the future of the land use of all our sites by minimizing negative impacts on the environment.

Delta Uranium recognizes the importance in respecting the environment while carrying out exploration activities. We are cognizant of advances in exploration technologies and the pertinent experiences of others as part of our objective of considering and respecting the interests of Stockholders in the exploration business.

Delta Uranium in support of our Environmental Policy is committed to:

- Identifying and evaluating environmental aspects of our exploration activities, then documenting procedures for minimizing the environmental impacts.
- Complying with all applicable environmental legislation and regulations recognized in industry standards.
- Communicating environmental requirements to employees and contractors to encourage and engage their participation and compliance.
- Providing appropriate training, and conducting internal assessment and periodic review of procedures to ensure that exploration activities are operated in compliance with corporate policy.
- Developing appropriate objectives and targets against which performance is regularly measured.
- Being proactive with environmental issues by identifying potential impacts and implementing preventive actions and/or developing effective contingency plans.
